

## Dura Industrial Secondary School

### LETTER OF RECOMMENDATION

**Ref:**DIS/REC/2026/002

**To:**The Admissions and Scholarship Committee

**Date:**09 July 2026

**Subject:**University Admission & Scholarship (B.Sc. in Cybersecurity)

Dear Members of the Admissions Committee,

My name is **Eng. Muayyad Haribat**, Instructor of Mobile Application Development at Dura Industrial Secondary School. I have known **Abdulaziz Adel Mohammad Al-Aqeili** since his first year of secondary education (Grade 11), and have worked with him on a voluntary and continuous basis over two academic years in repairing and maintaining devices and systems in the school's mobile applications workshop. It is my honor to recommend him for admission to your Bachelor's program in Cybersecurity.

#### Nature and Duration of Collaboration

Abdulaziz was not a student in my formal classes, but he came to the applications workshop voluntarily and repeatedly during the academic year. Over two years, he helped me diagnose and repair device malfunctions across the school: corrupted or compromised Windows systems, BIOS configuration issues, hardware failures, and devices requiring complete system reinstallation. He did this out of a genuine desire to learn, without any financial compensation.

#### Self-Initiative in Programming

What drew my attention to Abdulaziz was his independent initiative to learn programming. Although his official specialization is Electrical Applications — not programming — he began teaching himself the fundamentals of **Kotlin**, the language used for Android app development. He would share videos with me explaining what he had learned — such as loops and their implementation — and he was modifying code and adding explanatory comments on his own. Although he paused this effort later due to the pressure of his final year exams, this initiative proved to me that he possesses a genuine technical curiosity that extends beyond his original specialization.

#### The Malware Incident

The most defining moment that demonstrated Abdulaziz's analytical capabilities occurred when we encountered a device infected with malicious software. While others suggested surface-level fixes, Abdulaziz diagnosed the problem precisely, stating that the virus had "**embedded itself deep in the hard drive**" — an accurate reading of rootkit-type malware behavior. He then prepared a complete fresh Windows installation from his own computer at home, where internet speed was faster, and brought it to school to repair the device. This incident revealed two critical mentalities: **security diagnostic thinking** and **practical initiative to solve the problem**.

## Personal Qualities

Through my work with him, I observed in Abdulaziz several qualities: precision in his work, patience with complex faults, willingness to work long hours without complaint, and a practical intelligence that enables him to connect information across domains. He also assisted me with administrative technical tasks — such as researching equipment prices and preparing technical documentation for projects. Our relationship was built on mutual respect; I saw in him a young man who learns quickly and solves problems efficiently.

## My Assessment of His Transition to Cybersecurity

When I learned of Abdulaziz's decision to study cybersecurity, I was not surprised. Through his work with me, I had seen him develop an unusual security instinct — he notices abnormal patterns in devices, thinks about breach scenarios, and searches for the root causes of faults. These are the same mentalities required of a penetration tester. I am confident that his practical background in devices and systems, combined with his programming curiosity, makes him a suitable candidate for this field.

## Thoroughness and Maturity Beyond His Age

Beyond device repair, Abdulaziz also assisted me with technical research for the school — sourcing equipment specifications, comparing prices, and preparing documentation for procurement decisions. He approached these tasks with the same diligence he brought to technical troubleshooting, often going beyond what was asked: verifying details, checking compatibility, and flagging potential issues before they became problems. This level of thoroughness is rare in a secondary-school student and speaks to a maturity that will serve him well in the rigorous environment of a cybersecurity program.

I should also note that Abdulaziz's decision to pursue cybersecurity did not surprise me. Over our two years of working together, I observed that he consistently approached technical problems with a security-oriented mindset — asking not just "how do I fix this?" but "why did this happen, and how could it have been prevented?" This instinct to seek root causes and preventive solutions is precisely the analytical foundation that distinguishes a capable security professional from a mere technician. I have no doubt that, with formal training, he will develop this instinct into genuine expertise.

## Conclusion

I recommend Abdulaziz Adel Al-Aqeili for admission to your Bachelor's program in Cybersecurity. He is a practical, technically intelligent, and self-driven young man. Although he comes from an electrical background, his volunteer experience in system repair and his initiative to learn programming demonstrate that his transition to cybersecurity is a considered decision based on genuine interest, not an escape from a previous field. I am confident that he will benefit from this opportunity and succeed in this domain. I remain at the Committee's disposal should any further clarification or information be required regarding his qualifications, character, or the work we accomplished together.

Sincerely,
